Subject:	Support HVM (working towards PVHVM)					
Description:	Running dom0 servers configured to allow guests in HVM mode may be desirable because:					
	* It's simpler for guests (requires no PV modifications, but benefits from any PV driver support)  * Allow for more guest types, i.e. non-Linux ones  * Allegedly higher performance for 64-bit guests (untested)					
	More info http://www.brendangregg.cor	on m/blog/2014-05	some i-07/what-color-is	of -your-xen.htm	the I	differences:
	A downside is that HVM is more complicated as it requires use of qemu, and historically there have been quite a few security issues in qemu that we have dodged due to only supporting PV guests. As a result I would expect enforced reboots due to security patching to be a lot more common. We would most likely segregate PV and HVM guests onto different hosts so that those remaining on PV would not experience the additional security reboots.
