Subject:	Add a way to set "power on" action		
Description:	When the bare metal server that a VPS is on is booted, currently the following sequence of events happens:		

All suspended VPSes are restored
All other VPSes are booted

There is no way to express that a VPS should not be booted, other than some gross hack like deliberately breaking its bootloader configuration.

More than once it has been the case that a customer has deliberately shut a VPS down (e.g. because it has been compromised) and then BitFolk has booted it again after a scheduled maintenance.

At minimum there should be a way to specify that the host "power on" behaviour is to leave the VPS off.

A more advanced feature could offer the following options:

Always boot
Leave shut down (require manual boot)
Last status (boot if it was shut down, otherwise leave shut down)
